

Thank you for your purchase. Please read the following statement carefully before use. Once used, it is considered to be an acceptance of all the contents. Please follow the manual instructions carefully during the installation.

Modification may result in personal injury and product damage. We reserve the rights to update the design and performance of the product without notice

HW-SMC802DUL-V1-A0

01 Introduction

The COMBO-XRotor-X11-MAX brushless power system is a plant protection power system that adapts to a single-rotor load of 20-22kg/rotor. The maximum thrust of a single-rotor is 44kg; it is suitable for a 50mm carbon fiber tube arm; the overall waterproof level is IPX6, and it is not afraid of rain pesticides, salt spray, high temperature, sand and dust, impact resistance, mud and sand resistance; the ESC uses FOC vector control, based on PMSM system algorithm optimization; the system has digital throttle and analog throttle, which can make the flight more stable; the system has power-on automatic detection, power-on voltage abnormal protection, over-current protection, stall protection and other protection functions; use CAN communication, with real-time data transmission; built-in fault storage function, can record fault data

02 Safety Precautions

- When use it please keep away from crowd, high voltage cable and obstacles and conform to safety norm.
- Never approach to the high-speed rotating propeller & motor so as to avoid being injured by blade
- Check if all the components are good before use. If there is any damaged component, please contact after-sale service for replacement.
- Check if the screw of connecting parts is loose or whether the motor is horizontal before flight. • The X11-MAX power system is connected to a circular tube arm with a diameter of 50mm.
- The color of the power system navigation light is optional. After removing the light housing, you can select the desired color by flipping the dial switch.
- The motor should be kept clean and can be washed with water after each fly has been completed.
- This function can be realized only when the flight controller has a CAN channel.
- There is no digital throttle for serial communication. Serial communication is optional for this power system.

03 Components of the Power System

04 Power system installation

- The whole power system has been assembled before leaves the factory. Unpack and take out the power kit to install on the rack of plant-protection plane as per the rotation direction of motor. • The yellow, gray and green cables are the data output. Upgrade signal wire (ESC system is upgradable) and digital throttle using the Hobbywing CAN protocol. The yellow wire is ground wire, the gray wire is CAN-High(CH), and the green wire is CAN-Low(CL).
- The optional serial communication power system. Yellow, red and green cables are the data output and upgrade signal line (the ESC system is upgradable)
- The black and white is the PWM throttle wire, the black wire is ground wire, and the white wire is signal wire
- The data signal line outputs in real time; the input and output throttle, motor speed, bus current, phase current, bus voltage, capacitor temperature, Mosfet temperature and other data.
- \bullet The throttle pulse width was fixed at 1050~1950µs.
- The CAN digital throttle needs to be adapted separately by the flight controller and the Hobbywing CAN protocol. Please obtain the agreement from Hobbywing sales, after-sales service, agents, flight control manufacturers, etc.

*Not: The picture is only for reference, please make the object as the standard.

05 Specifications

Recommend Take-off Weight: 20-22kg/rotor (70V, Sea Level) Recommended Battery: 18S LiPo (Max 78.3V) Powertrain Arm Tube Outer Diameter: 50mm Protection Grade: IPX6 Maximum Torque: 11.8kg (70V, Sea Level) Operating Temperature: -20°C-50°C Total Weight: 28000g (INC. prop)

Support throttle Frequency: 50-500Hz

Continuous Current: 50A (Non-hermetic Ambient Temperature ≤ 60°C) Maximum Current.: 150A (Non-hermetic Ambient Temperature ≤60°C) Recommended Battery: 18S LiPo Throttle Pulse Width.: 1050-1950µs

Motor Stator Size: 11122 Diameter Pitch: 48*17.5 inch Weight (INC. adapter): 397g

Motor dimension: 120*55.2mm

KV: 60

Jo Parameters

		Throttle (%)	Thrust (g)			Speed (RPM)	
		40%	10800	15.1	1044.7	1525	10.3
		42%	11830	17.2	1192.7	1595	9.9
		44%	12875	19.5	1350.0	1664	9.5
		46%	13920	21.9	1514.0	1729	9.2
	HW 48*17.5Inch Foldable Propeller	48%	14975	24.4	1686.0	1792	8.9

07 Protective function

When the power is connected normally, the ESC will first start the self-test. If the self-test is successful, it will run normally after beeping. If the self-test fails, it will not start and the flashing light will act as warning sign.

Stall Protection

When the ESC detects that the motor is locked, the ESC will completely turn off the output and will not restart the motor. At this time, it is necessary to power on again to clear the error and restart the ESC to restore power output.

Current protection

When it detects that the instantaneous current abnormality reaches close to 320A, the ESC will restart immediately, and the output will be turned off if the number of detections reaches 6 consecutive times. After the motor stops, it will return to normal after power on again

When the ESC detects that the throttle remote control signal is lost for more than 0.25 seconds, it will immediately turn off the output to avoid greater losses caused by the continued high-speed

rotation of the propeller. After the signal is restored, the ESC will immediately restore the corresponding power output. · Temperature protection This power system has no temperature protection, and will only send out an alarm when the temperature of the ESC is higher than 110°C. The flashing lights will be 1 long and 3 short, and 1 long

and 4 short. When the temperature exceeds 130 degrees, the ESC may be burnt. Upon seeing the prompt, please land immediately

08 Warning tone description

Motor fails to start after power on	"Beep beep beep" rapid monotone	Throttle is not reset to zero	Push the throttle to the lowest point or recalibrate the throttle point
Motor fails to start after power on The power-on voltage is lower	"Beep, Beep, Beep" (2 second for each interval)	No throttle signal input on the receiver throttle channel	Check if transmitter and receiver is normal. Check if wiring of throttle channel is normal
than 18V or higher than 82V	"Beep , Beep , Beep" (1 second for each interval)	Battery voltage is too low or too high	Replace with a suitable battery

09 Daily usage

Adjust LED light color

Use a tool to take out the M3×8 screws that fasten the lampshade, and set the switch according to the corresponding light color below (factory default green). After the setting is successful, assemble

Dial code on/off 1			
ON	ON	ON	White
ON	OFF	ON	Blue
ON	ON	OFF	Purple
ON	OFF	OFF	Blue
OFF	ON	ON	Yellow
OFF	OFF	ON	Green
OFF	ON	OFF	Red
OFF	OFF	OFF	LED Off

2 Description of light color status

		Solution		
Single short flash	Over-voltage	Replace the battery (Voltage below 82V)		
2 short flash	Under-voltage	Replace the battery (Voltage higher 24V)		
3 short flash	Over-current	 Check the motor for foreign objects and check the propeller, then power on again Contact after-sales service 		
Single long flash	Throttle lost	 Check connection between signal line to the flight controller Check whether the remote controller and flight controller are turned on Check the resistance of the black and white wires, if there is a short circuit, contact the after-sales service 		
Single long flash + Single short flash	Throttle not reset to zero	This problem occurs during the rotation of the motor. Please check the aircraft battery and circuit. There is a short circuit on the circ		
Single long flash + 2 Short flash	Mosfet overheated (Over 110°C)	Cool down the power system and power on again		
Single long flash + 3 Short flashes	Capacitor overheated (Over 110°C)	Cool down the power system and por	wer on again	
Single long flash + 4 Short flashes	Stall protection	 Restart after the throttle is reset to zero Please check if there is any foreign matter in the motor, rem 	ove the foreign matter before starting	
2 long flashes	ESC open-circuit	Please check whether the motor circuit is intact	Contact after sales service	
2 long flashes + Single short flash	ESC short-circuit	Please check whether the motor is in good condition	Contact after sales service	
2 long flashes + 2 Short flash	Motor short-circuit	Please check whether the motor is in good condition	Contact after sales service	
2 long flashes + 3 Short flash	Phase A operational amplifier is abnormal	Re-power on to return to normal	Contact after sales service	
2 long flashes + 4 Short flash	Phase B operational amplifier is abnormal	Re-power on to return to normal	Contact after sales service	
3 long flashes	Phase C operational amplifier is abnormal	Re-power on to return to normal	Contact after sales service	

Replacing the propeller

- Use the appropriate tools to take out the two propeller fastening screws in and replace them with intact propellers. If you need to replace the propeller clips, continue to take out the fastening screws and replace the whole set of propeller clips and propellers.
- Installing the propeller clip blades
- Firstly, install the bottom cover on the motor, followed by the propeller blades, propeller gaskets, upper cover (propeller clips) and the final screws in order; pay attention to the installation of the propeller screws, After clamping, the propeller should rotate freely, and make sure that the propeller clamp and the motor fastening screw are tightened and screw glue is used at the same time.

Firmware upgrade

There are two ways to upgrade the software: online upgrade via a computer or using flight control remote. The explanation using the flight control remote are as follows.

This function needs to use DataLink data box, special DataLink software for upgrade package, and USB data cable. DataLink data box version requirements, LINK-01.2.14-C or higher version, LINK-01.2.09-U or higher version; DataLink software contact Hobbywing to obtain.

Note: Please ensure that the computer has already installed the Microsoft Visual C++ 2013 before or later using. An upgrade package contains only one program for each ESC. For other programs, please obtain a new upgrade package. For additional details, please refer to the DataLink user manual. The upgrade package can be obtained at the place of purchase; Hobbywing official website, dealers, Hobbywing sales, Hobbywing, and after-sales service. The FOC ESC is one-dimensional and can only be upgraded on a fixed version, not at will.

Note: It can only be upgraded from the existing program. Software and hardware cannot be upgraded together.

4.1 CAN ESC upgrade

Connect the computer and the DataLink data box with a USB cable

ESC---->DataLink data box "yellow red green"---->"- 🗆 D", any channel from D1-D8 is acceptable, and it is recommended to use D1 channel first.

It can be obtained at the place of purchase; Hobbywing official website, dealers, Hobbywing sales, and Hobbywing after-sales service.

Note: It can only be upgraded from the existing program, and software and hardware cannot be upgraded together 3) Operation

Click "Uart->ESC(FAST)", the ESC firmware

n "Available Version", select the desired

irmware and click "Update"

1) Connection

2) Operation

Connect the computer and the DataLink data box with a USB cable; ESC---->DataLink data box "yellow gray green"----> "- CH1 CL1 ".

Click "DataLink" of the software.Check the data The USB cable is connected to the data box, Run the DataLink software and the ESC is connected to the data box. LINK-01.2.09-U or late Select the "Scan" button first, and then After the channel on the page is ticked, After the hardware and firmware information power on the ESC. select the "Stop" button. appears on the page. After the upgrade is complete, please scan again to confirm that the program is upgraded successfully. Wait for the upgrade to complete, if the There is no sequence of power off, and the equipment will not be burned.

5 ID set up

If there is no requirement, the default factory ID of the ESC is 1, the throttle channel is 1, and the bus speed is 500Hz

This function is only available for CAN communication ESCs, and the serial port does not have this function. This function can communicate with the flight controller to realize digital throttle. This function requires the additional purchase of DataLink data box

Before using this function, ensure that the computer system is installed with the Microsoft Visual C++ 2013 software in advance to operate.

ESC---->DataLink data box "yellow gray green"---->"-CH1 CL1";

Connect the data box to the computer via USB. Please remove the paddle to avoid danger upon changing the ID.

For the same aircraft, different ESC IDs and throttles cannot be the same. Otherwise, ESCs with the same ID will be recognized as one ESC upon using the CAN function,

The ESC is connected to the data box, and Enter the software page, confirm the software version of DateLink in the type "DataLink", and ensure Run the DataLink software that the program version is above LINK-01.2.14-C. the data box is connected to the compute Click "Set ID and Throttle Channel" and Wait for the bus speed automatic setting Set ID and Throttle Enter the CAN parameter adjustment page. wait for the data to be saved. The equipment is powered off, there is no Check the prompt in the upper left corne sequence of power outages, and the to see if the setting is complete. equipment will not be burned.

6 Fault storage

The ESC has its own fault storage function to store the time during power-on, flight time, and fault time information. This function drastically improves the quality of live and makes it convenient for

flight fault analysis. Please note that this function only records the data at the time of failure, and not all flight data. This function requires the use of DataLink data box, serial port assistant, DataLink software, and USB data cable.

Note: DataLink software can be obtained from Hobbywing official website, dealers, Hobbywing sales, and Hobbywing after-sales.

DataLink data box version requirements, LINK-01.2.15-C or later; serial port assistant requirements, USB to TTL; DataLink software requires a fault storage version, which can be obtained from the official website, WeChat official account or after-sales.

The DataLink box has three power supply methods; USB data cable, serial port assistant, and external power supply cable. You can choose one of the power supply methods, and there is no need to repeat power supply.

Note: For detailed steps, please refer to the DataLink user manual.

1) Connection

Serial assistant ----> DataLink data box "GND 5V TX RX" ----> "- + RX2 TX2"; CAN communication ESC ----> DataLink data box "yellow gray green" ----> "- CH1 CL1", multiple ESCs can be used in parallel.

Note: Upon using multiple ESCs in parallel, the ID and throttle number must be set differently in order for one ESC to be recognized.

Serial communication ESC---->DataLink data box "yellow red green"---->"- 🗆 D", any channel of D1-D8 is acceptable, and it is recommended to use D1 channel first.

Note: This function requires the serial port assistant. Before using it, please ensure that the serial port assistant is in working coditions. If it cannot be used, please replace the serial port assistant and try again.

10 After-sale maintenance

In the event that the equipment of the power system is damaged, please contact Hobbywing after-sales customer service immediately. Under the premise of not affecting the performance, make sure that you can use the Hobbywing power system kit accessories for replacement after contacting the customer service. Users are prohibited from configuring accessories by themselves (such as screws, paddle clips, propellers) for replacement.
